

Calmagphos Ewe Mineral Lick

Delivers a palatable source of magnesium and calcium to lactating ewes at correct proportions, reducing the risk of an imbalance in an animal's calcium:phosphorous ratio.

Feeding Instructions

Calmagphos should be fed ad lib to ewes for up to 2 weeks prior to lambing and during periods when ewes are grazing fresh green cereals/grass pastures. This ensures an adequate and digestible calcium source for the animal.

Ingredients

Calmagphos contains stocklime, magnesium sulphate (Epsom), dicalcium phosphate, molasses and sodium chloride (salt).
